**Priority Applications (Number Kind Date):** FR 8811086 A ( 19880822)

**Abstract:**

FR 2635455 A

A dental prosthesis implant consists of a stem (18) with a hollow threaded head (19) and a lower threaded shank (20). The stem is equipped with a safety/transfer sleeve (22) which fits over the head of the stem and can be used to rotate it, e.g. by an outer surface which can be gripped by a tool and by matching outer and inner surfaces of the head and sleeve respectively, e.g. of hexagonal cross section.

After the sleeve has been used to screw the stem into position it can either be removed, or it can be fixed to the stem by a screw (27) and used as a support for a prosthesis.

**ADVANTAGE** - Easier to fit and offering greater security. (19pp Dwg.No. 2/10)
